ABSTRACT

HIRSCHMAN AND IRISH INDUSTRIAL POLICY

In this article we examine the origins of Whitaker’s export oriented industrial policy and the political management of its implementation. Whitaker appointed academic economic advisors, including Louden Ryan, to a Capital Investment Advisory Committee in 1956. The advice from this committee was to become a cornerstone of Whitaker’s industrial policy. Using the archives of the Statistical and Social Inquiry Society of Ireland (SSISI), we show that industrial policy at its inception was shaped by the economic theories of Hirschman (1958). Hirschman’s theories were adopted for Ireland’s vision of economic development via the writings and counsel of Ryan.

Keywords: Hirschman, Holistic Industrial Policy, Political Economy, uneven development, export promotion and linkages.

Publication information

This paper was presented to a conference to mark the contribution of Professor Tom Garvin to UCD and to the political science community in March 2009. The conference was entitled “Politics, Economy and Society: Irish Developmentalism 1958-2008”. We thank all participants for their comments. This manuscript has benefited greatly from detailed comments from Bryan Fanning and Tom Garvin.
**Patrick Paul Walsh** is a professor in the School of Politics and International Relations at UCD. He received a Ph.D. from the London School of Economics and Political Science. During 1992-2007 he worked in Trinity College Dublin and left as an Associate Professor, College Fellow and Dean of Social and Human Sciences. He was a Visiting Professor at K.U. Leuven during 1997-1999 and a Research Scholar in the Department of Economics, Harvard University during the academic year 2002-2003. His professional activities include being Editor of the Journal of the Statistical and Social Inquiry Society of Ireland and runs a related IRCHSS funded "Our Polestar is Truth" project based in the Long Room Hub in TCD. He is on the Standing Committee for Social Science in the European Science Foundation. He coordinates UCDs HEA-Irish Aid Programme of Strategic Cooperation 2007–2011. This Programme runs a flagship "Sandwich or Swedish Model" UCD Ph.D. in Global Human Development, among other things. He also chairs a TCD-UCD Masters in Development Practice that is part of a Global Network based at the Earth Institute at Columbia University and funded by the MacArthur Foundation. He is on the management committee of the UCD Geary Institute. Amongst other publications he has published in the Economic Journal, Journal of Industrial Economics, Oxford Bulletin of Economics and Statistics, Journal of Comparative Economics, and the Economics of Transition.

**Ciara Whelan** completed her Ph.D. in Economics (Trinity College Dublin) in 1997 (conferred 1998). She then undertook postdoctoral studies at the London School of Economics, Economics of Industry Group. She was an Economics Research Council Fellow, Katholieke Universiteit Leuven 1998-1999. She is a College Lecturer in the Department of Economics, University College Dublin since September 2000. Winner of the Barrington Medal for Young Irish Economist in 2002. Her research interests are in applied industrial economics, including structural models of industries and industrial development. Amongst other publications she has published in the *Journal of Industrial Economics, International Journal of Industrial Organization, Review of Industrial Organization,* and *The International Review of Law and Economics.*
INTRODUCTION

Ireland in the late 1950s had an industrial base that was cultured on import substitution industrialization where protectionism for three decades encouraged home-grown firms to replace imports of final goods by domestic production. The level of effective protection was extremely high by international standards, although there was a good deal of variance across 4-digit industrial sectors (McAleese, 1971). ¹ In the late 1950s the concept of industrial development changed. The emphasis was on export promotion, using financial incentives and enhanced capabilities to support exporting companies during trade liberalisation. Seán Lemass, one time Taoiseach of Ireland and Dr. T K Whitaker, a civil servant, are credited for this inspirational approach to export oriented industrial policy and are regarded by many as the architects of modern Ireland. ²

In this article we examine the economic thinking behind the radical change in industrial policy put forth by Whitaker, and the political management of its implementation. Researching the archives of the Statistical and Social Inquiry Society of Ireland (SSISI), we see Whitaker’s ideas and writings on capital formation take shape in public meetings of the Society. Whitaker appointed academic economic advisors, including Louden Ryan, to a Capital Investment Advisory Committee in 1956.³ The advice from this committee was to become a cornerstone of Whitakers industrial policy. This paper will show that industrial policy, at its inception, was strongly

¹ Before Ireland signed the General Agreement on Tariffs and Trade (GATT) in 1960 and the Anglo-Irish Free Trade Area Agreement (AIFTA) in 1966, the average effective tariff level was nearly four times the level observed in trading partners. Garvin (2004) considers the move away from free trade in the 1930s until 1960 as a major mistake in terms of Ireland’s human and economic development.

² Sean Lemass served as Taoiseach from 1959 through to 1966. Whitaker was appointed Secretary at the Department of Finance in 1956, where he served until 1969.

³ Louden Ryan was then a Professor of Industrial Economics in Trinity College Dublin. The Capital Investment Advisory Committee had three economic advisors appointed to it, Professors Louden Ryan, Charles Carter and Paddy Lynch. Whitaker and is academic advisors where regular participants in the meetings of the society. Whitaker (1955) presented his own paper to the society on capital formation and we see him writing with his advisors, Lynch, Whitaker, et al. (1945) having a “Discussion on the problem of full employment” in the public meetings of the society. Fanning (2008): “Within the civil service the key architects of the new official climate were Whitaker and Lynch. Their double-act began with their participation as junior Finance officials in a debate on full employment at the Statistical and Social Inquiry Society (SSIS) in April 1945”, pp194-5.
shaped by economic theories of Hirschman (1958), which were adopted for Ireland’s vision of economic development via the writings and counsel of Ryan.4

In the next section of the paper we examine the political economy behind the rise of exporting and the corresponding decline of import competing firms, or horizontal changes in industry structure. As highlighted by Hirschman (1957), one of the problems with the process of economic growth in developing countries is the resultant “dualism”, or as he puts it, the “uneven course of progress of different industries and geographical areas within a country” (p.569). Such a dualism is very evident in Ireland in the 1960s and 1970s where we see the coexistence of traditional import competing industries, located mainly around Dublin, and the emergence of modern export oriented industries located in industrial parks, mainly outside Dublin. Hirschman was aware of the social and political consequences of uneven development, as evident in his 1968 paper on the political economy of import substitution where he concludes that as a result of dualism, “.... exporting meets with political and institutional, rather than purely economic, obstacles...” (p.31). He provided no clear economic framework on how to deal with these political constraints however. Yet, as we will see Whitaker did take on board these political constraints in his drive towards free trade as we show how he politically managed these horizontal changes in industry structure.

In section III we examine the supply side of Whitakers export lead industrial policy, which focused on the role of supply side capabilities. Within a framework that had a holistic view on supply side supports, there was focus on a much needed change in the vertical structure of industry, as represented by the development and enhancement of the domestic supply of intermediate goods and services for exporters. We show how the policy evolved from the advice of Ryan, then a member of the Capital Investment Advisory Committee. Ryan (1961) emphasised the key role of industry linkages for the economic development of the Irish economy, based on the economic framework established by Hirschman in chapter 6 of his book The Strategy of Economic Development (1958). In this framework, one of the key elements to inducing growth in developing countries was the establishment of linkages between firms. To quote Hirschman, “… important stimuli result nevertheless from the fact that the setting up of an industry brings with it the availability of a new, expanding market for its inputs whether or not these inputs are supplied initially from abroad” [1958: p.99]. Establishing firms involved in the production of exports can obviously lead to the demand induced creation of domestic firms involved in the production of inputs (goods or services) which may or may not have been supplied initially from abroad.5

4 The highly influential economist Albert Otto Hirschman was a Professor in Yale University (1956-1958), Columbia University (1958-1964) and Harvard University (1964-1974).

5 Hirschman (1958) emphasises that imports of intermediate goods can be crucial in establishing new industry. Over time, once demand has been established for these inputs, domestic industry may develop to replace these imports. He further argues that domestic availability of these inputs is a “more effective spur to further development” than foreign supply because (i) importing requires special skills and so reduces the number of potential entrants (ii) importing is more risky as it is subject to balance of payment uncertainties and (iii) domestic production of an input will enhance the efforts of those producers to propagate its further uses. Empirical evidence on the important role that importing of intermediate goods can play can be found in Amiti and
Hirschman (1958) describes such a process as backward linkage effects. He also highlights the fact however, that when an industry develops and generates such effects, these may in turn generate forward linkage effects. This occurs as the domestic availability of inputs attracts new and expands existing plants whose production uses these inputs. Li, Walsh and Whelan (2009) empirically examine the importance of linkages in Irish manufacturing over the period 1972 through 2003, and find that inputs and innovations by small indigenous suppliers of intermediate goods are of paramount importance to the entry, performance and survival of exporting plants across all industry and ownership types. In this article we show that such linkages were an outcome of a targeted industrial policy with a solid economic foundation in Hirschman (1958). Hirschman’s big idea was to move away from an industrial policy that promoted Import-Substituting Industrialization (ISI) of final goods to one that promoted ISI of intermediate products that supplied exporting companies. Building ongoing backward and forward linkages between exporting and non-exporting domestic companies became the focus of industrial policy for employment creation and innovation.

In the last section we make our conclusions and discuss briefly how the basic thinking around a “holistic” Industrial policy conceptualised in the late 1950s did not change over the decades, but was bedded down in more complex institutional structures, particularly after reviews of industrial policy by Telesis (1982) and Culliton (1991).

II. HORIZONTAL CHANGES IN THE STRUCTURE OF INDUSTRY

The move away from the protectionist policies instituted in the 1930s, lead to a predictable rise in exports. However, while exports as a share of gross output in manufacturing showed a steady increase since the sixties (figure 1), beneath these statistics there has been a fundamental change in the structure of industry which has been ongoing across four decades. In this section we examine the political economy of industrial policy in the late 1950s in Ireland in terms of the impact this has had for horizontal structure of industry. We first illustrate this change.

Konings (2007) where trade liberalisation in Indonesia is shown to allow productivity gains from the use of imported intermediate goods.

Ó Gráda and O'Rourke (1995), using the Economy Database from the Groningen Growth and Development Centre, http://www.ggdc.net, note that Ireland GDP per capita since 1950 took the same amount of time to converge to the EU average as other EU countries but what was different was the fact most of the convergence was condensed into the period after 1987. Walsh in a reply in Sexton (2007) examines Ireland productivity from 1950-2005 using the same data. He plots the ratio of labour productivity in Ireland to that in the US, per hour worked, in 1990 US$ in PPPs. The trend since 1950 has been a relentless gradual improvement in labour productivity which has led Ireland to converge on the US levels. Employment to population trends are very unusual in Ireland, particularly during the period up to 1987, due to discrimination against women, migration and structural unemployment. We argue that one should think in terms of a gradual evolution of the exporting industrial base from the late 1950s using a broadly speaking coherent industrial policy for the next four decades. We do not see 1987 as a defining structural break in terms of industrial development.
Horizontal changes in the structure of industry are represented in the literature, by the expansion of exporting firms and the corresponding decline of traditional import competing firms (see Barry, 1999 and O’Malley, 1989). This is evident in figure 2, which shows since 1970 (i) the collapse of traditional non-exporters (established pre-1973)—particularly in those sectors dominated by Home ownership and (ii) the simultaneous expansion of de novo (established in 1973 or later) exporting firms—particularly in those sectors dominated by US ownership. Within Home industries the huge collapse of traditional non-exporting plants did not switch into exporting, but rather were phased out.

Whitaker was well informed about the inevitable benefits that a move away from protectionism would bring for the economy. Equally, he was fully aware that there would be some “losers” (namely, the import competing firms) from the change in policy. Hirschman (1957) warns that, as a consequence of growth, “... the resulting split of a developing nation into advanced and traditional sectors may be of considerable width and duration and that this split may in turn affect the nature and direction of subsequent development” (1957: p.569), and that the political process would be difficult as a result (Hirschman, 1968). Implementation of the policy would not be politically easy, yet despite much ongoing opposition to his new industrial policies, Whitaker prevailed. This is evident in Whitaker’s book Protection or Free Trade—the Final Battle (2007), where he documents a letter of correspondence which he received from JCB MacCarthy (the then secretary for the Department of Industry and Commerce) on 9th January 1960:

Dear Whitaker,

Thanks for your letter of the 7th of January, though it grieves me to note that our exchange of correspondence seems to have done little to bring the discussion down to earth.

The viewpoint expressed in your letter that our industries would gain more from expanded exports than they would lose in the home market, and that there is no need to fuss about getting an adequate quid pro quo for joining either EFTA or Britain in a free trade association, is so far removed from our viewpoint that I agree there is no point in continuing the correspondence.

Yours Sincerely,

JCB MacCarthy

Whitaker’s response, on the 11th January 1960, had the last word on the argument:

Dear MacCarthy,

___________________________

7 The data source for these graphs is the Annual Employment Panel Survey carried out by Forfás over the period 1972 to 2003 and the Forfás annual expenditure survey 1983-2003 covering all manufacturing companies. Li, Walsh and Whelan (2009) classify sectors as either Home or US, where the majority of plants, in terms of their contribution to sector employment, over the period 1970 to 2003 are Irish owned or US owned respectively. While clearly there are UK and other non-US Foreign owned plants, these do not aggregate up to a majority in any sector.
I suppose I am entitled to the last word in our correspondence about the Reasons for Reducing Protection. I am sorry it must be that I cannot accept the second paragraph of your letter of 9th January as being a fair or reasonable summary of the views expressed in my previous letters.

Yours Sincerely,

TK Whitaker

Due to the political difficulty of implementing a policy of free trade, where there would be well defined and evident losers under the policy, Whitaker manages the drive toward free trade in a controlled and phased manner. In addition to tariff reductions, there were associated incentives to export including export tax relief and capital grants. Such grants were used to attract green field export oriented Foreign Direct Investment in new industries, and similar incentives were given to Irish owned export oriented companies that were start-ups. However, tariffs were not abolished in one stroke, while incentives to export were introduced over a period of time. In her paper read before the SSISI in 1985, McHugh outlines a selective chronology of major policy measures introduced in Ireland since 1949 (McHugh, 1985: table 1). This clearly illustrates that the lowering of tariffs coupled with the implementation of exporting incentives were introduced piecemeal over a twenty year period, as exemplified by:

<table>
<thead>

ration profit tax for all manufacturing in 1981-2000 inclusive

(source: extracts taken from McHugh: 1985, table 1)

The phased diminution of tariffs and the gradual introduction of exporting incentives
were done to minimize the political instability of implementing free trade to the Irish
economy. Roland (1993) and (2000) provides a theoretical framework that explains
the difficulties inherent in implementing a set of reforms aimed at increasing social
welfare under political constraints, along with the associated implementation costs
and uncertainty regarding their benefits. The basic problem with social reforms is
that the losers of a reform tend to be a minority group that can calculate their losses
with certainty. The winners are a majority of the population that are not only uncer-
tain about the gains, but expect small gains on an individual basis as gains are
spread across the population. Hence most social reforms have an overall negative
“expected” outcome on the population ex-ante. Since governments depend on
population votes, this makes the introduction of social reforms a hazardous task.
Modern theories demonstrate how governments with a set of reforms and an infor-
mation advantage on the cost and benefit of each reform can circumvent this pro-
blem.

Dewatripont and Roland (1995), building on the seminal work of Alesina (1987),
model a politically acceptable way of introducing a set of reforms that are necessary
to maximise social welfare but have ex-ante an overall negative “expected” outcome
on the population. Their theory assumes that governments have a clear idea of the
ex-post costs and benefits of each reform ex-ante. Reforms yielding large ex-post
positive effects should be implemented first. The more painful reforms become po-
litically easier to implement at a later stage. “This is the effect of building constitu-
cencies, using the ‘sweet pill’ of early reforms to have the population swallow the ‘bitter
pill’ of less popular reforms” [Roland: 1993, p. 535]. He illustrates this in relation to
the restructuring of previously State Owned Companies in Central and East Euro-
pean (CEE) countries, where sequencing was recommended: the best companies,
requiring limited employment loss and restructuring, should be privatised and re-
structured first, while the imposition of private ownership and competition on loss-
making companies, requiring large employment loss and a great deal of restruc-
tring, should come at a later stage.9

9 Walsh and Whelan (2001) document the nature of sequencing in the privatisation process across CEE
countries using company level survey data and show that the better companies selected themselves or were
selected first.
Roland (2000) provides a theoretical foundation that explains how governments can control interest groups and design reform that achieve the twin targets of maximizing social welfare (interests of society) and winning political support. Politically, Whitaker realised that in order to navigate the move to free trade, the introduction of export tax incentives (yielding positive gains) should be embedded first. Then, once the benefits from these reforms have taken hold in the economy, the more painful reforms of tariff reductions should be implemented, but in a phased way. Whitaker backed green field exporting companies based outside Dublin to deliver prosperity for Ireland, even though the jobs and power were on the side of the traditional, heavily unionised and highly protected industries in the greater Dublin area. The phasing out of these industries was gradual, allowing exporting companies’ time to compensate. Derogation on Ireland phasing out tariffs during the period 1973-1979 after joining the EC is an obvious example of how this was achieved.

III. VERTICAL CHANGES IN THE STRUCTURE OF INDUSTRY

The story of Irish manufacturing over this period is not simply about the loss of jobs in traditional import competing plants and the generation of jobs in exporting plants. Figure 2 also documents the strength in traditional exporting companies in both home and US industries. The incentives for start-ups in exporting were open to both home and foreign companies and the success of indigenous industry should be noted. In addition we should note the growing presence of de novo non-exporting plants in both Home and US industries. While the total employment created by these companies at a point in time may have been relatively small, Table 2 shows that these companies eventually dominated the landscape in terms of plant numbers. Moreover, as shown in Li, Walsh and Whelan (2009), innovation in these small Irish businesses allowed exporters in both Irish and US dominated industries to flourish.

This section of the articles examines the supply side of the Irish industrial development policy. In addition to the pursued policy of export promotion, there was an active pursuit of enhanced capabilities to support exporting companies during trade liberalisation. The following policy measures were introduced with a clear objective of enhancing supports for the new industrial exporting base:

10 The line of causality runs in the opposite direction to traditional theories as outlined in Stigler/Peltzman (1976) and Becker (1983). These argue that reform is likely to target minority groups with strong preferences rather than majority groups with weak preferences. The possibility of government failure in the design of reform is therefore highlighted, where governments advance the needs of particular interest groups rather than maximize social welfare.

11 While academic papers, in our view, did not highlight the role linkages enough, there are a few papers that did examine linkages. McAleese and McDonald (1978) highlight employment growth and the development of linkages in foreign-owned and domestic manufacturing enterprises. More recently Görg and Ruane (2000) examine linkages in the Irish electronics sector.

12 The attractiveness of a rich domestic supply of inputs (goods or services) depends upon the capabilities of those firms involved “...‘capability’ can be thought of as comprising two elements: a measure of the maxi-

Adaptation grants replaced by Re Quipment Grants payable by the IDA at rate of up to 35% in Designated areas and 25% elsewhere

(source: extracts from McHugh: 1985, table 1, with the exception of the 1956 measure which was not included in her table)

The need to couple the export promotion policy with a change in the vertical structure of industry, as represented by the development and enhancement of the domestic supply of intermediate goods and services for exporters, is evident in Whitakers 1956 paper on Capital Formation in which he outlined a number of important factors for economic development:

The first of these is the development of a better appreciation of the dependence of material progress on individual output. Others are a raising of the general level of education, health and skill, the loosening of restrictive practices, whether of employers or employees, the practical encouragement of initiative and enterprise, the adoption of improved methods, techniques and principles of organisation and management both in agriculture and industry, and a greater readiness to apply scientific advances (Whitaker: 1956, p.188).

These ideas are reflected in Killeen (1975), then Managing Director of the IDA, who outlined the two pillars of industrial policy to the Statistical and Social Inquiry Society of Ireland: export incentives and supports. In terms of supports Killeen (1975) states

We have come to appreciate that providing the full range of back-up services needed by industry (i.e., in addition to IDA activities, grants and other incentives) is a complex process which depends on a host of development agencies working in a planned and synchronised way: local authorities in providing water and sewerage; planning authorities, the IIRS and An Foras Forbartha in assessing and advising on complex planning application; the banks and Industrial Credit Company in completing financial packages; Coras Trachtala marketing services; AnCo and the National mum quality level that the firm can achieve, and a measure of its cost of production (productivity) for each product line. It is a firm’s relative capability vis-à-vis its rivals that will turn out to matter…” [Sutton, 1997: p.2].

-8-
Manpower Services providing the trained labour force, and so on for the ESB, Department of Posts and Telegraphs, CIE etc. From an operational viewpoint, the institutional co-operation and joint financing needed for industry is an immense administrative problem. Certainly, the IDA alone without the services of these other agencies, could achieve virtually nothing. That so much has been achieved in the past five years is a tribute to the level and quality of the co-operative effort by all these agencies.

Killeen also emphasizes the importance of targeting policy to the development of export oriented service type industries, such as consulting, engineering, computing, labour market training, Research and Development. This translates into the importance of building up a rich supply of core capabilities for exporting plants. In addition to the general equilibrium supports, Killeen (1975) highlights the need for downstream linkages to exist inside industries as a core capability that Ireland can offer. Apart from accrue ment of additional profits and wages, the ability of local companies to embed themselves in the stages of production (processing, supply chain, or R&D) of a particular export product line can result in substantial improvements in capabilities (productivity and quality) of exporting companies leading to their long term presence in Ireland. Sutton (2000, 2004 and 2007) models and articulates these issues.

It would therefore appear that in their concept of industrial policy formulated in the late 1950s Lemass and Whitaker not only anticipated the shakeout of traditional import competing manufacturing plants, but they further understood that export growth would only happen, however great the financial incentives, if a location could offer core supply side capabilities to exporting plants. They understood the relationship between non-exporting and exporting plants would become vertical, and had an acute understanding of the product specific nature of investment needed into supports. In short, they had a grasp on the importance of industry linkages.

Such an insight and understanding of the dynamics of industry that would be set in motion with the move away from protectionism, it turns out, emanated from a sound theoretical economic framework. In his recent book, Whitaker (2007) clearly highlights his collaboration with three academic advisors on the Investment Advisory Committee:

....in May 1956, I read a paper to the Society entitled ‘Capital Formation, Saving and Economic Progress’ which emphasised the need for more productive investment to help take us into an economic upswing. Later that year, the Capital Investment Advisory Committee, under the chairmanship of John Leydon, former secretary of the Departments of Industry and Commerce and of Supplies, was set up by the Department of Finance. I kept in touch with Professor Louden Ryan and other two professional economists on the Committee, Professors Charles Carter and Paddy Lynch (Whitaker: 2007, p 9).
The economic ideas of the economist Ryan are put forth in his paper on *Investment Criteria in Ireland* which he read before the SSIS on 17th November, 1961. Here, Ryan emphasised the importance of investment in capital intensive rather than labour intensive projects. Successful capital investment would lead to eventual job creation through linkage effects. The key criterion for economic growth put forward, to which Ryan devoted most of the paper, was the Linkage Criterion as credited to Hirschman (1958). As explained in the introduction of the article, with the development of export oriented firms comes the simultaneous demand for domestically produced high quality intermediate goods and services (backward linkages) and these in turn attract new plants and enhance the performance of existing plants that use these inputs (forward linkages).

Whitaker took seriously the notion of industry linkages, as his industrial policy twinned the incentives to export with a series of supports for exporting industry in the guise of investment in infrastructure, skilling up of the labour force, implementing a regional policy to enhance linkage effects by location, grants to encourage start-ups and industrial adaptation. As a result, the story of Irish manufacturing is not simply about the haemorrhage of jobs in traditional import competing firms and the generation of jobs in new exporting firms that resulted from the move away from protectionism. Active policy and supports ensured the development of core capabilities in all industries and allowed non-exporters to play a key role in enhancing the capabilities of exporters to become a world leader in manufacturing (see Li, Walsh and Whelan, 2009).

**IV: CONCLUSIONS**

This article examines the origins of Whitaker’s industrial policy for Ireland. We firstly considered the political management of the move toward free trade, which resulted in horizontal changes in industry structure: the rise of exporting and corresponding decline in import competing industries. Whitaker was aware of the challenges for economic and regional development created by the dualistic structures outlined in Hirschman (1957). The implementation of this policy had an underlying theoretical framework that enabled tough measures to be executed under political constraints. Politically, Whitaker realised that in order to navigate the move to free trade, the introduction of export tax incentives (yielding positive gains) should be embedded

---

13 The criteria put forward in that paper include: Profit as a Criterion; Labour Intensity as a Criterion; Linkage as a Criterion; Balance of Payments Criterion; New Resource Criterion and Net Social Productivity Criterion.

14 White (1982), then Director of the Industrial Development Authority (IDA), explains that while labour intensity was not a key criterion for investment in manufacturing, linkages to other sectors would create a lot of employment.

15 The endogenous growth model of Aghion and Howitt (1992) emphasise the need to have turnover, inducing innovation, in companies that provide intermediate goods in order to have economic growth. Repkine and Walsh (1999) apply this to Central and Eastern Europe and provide evidence that rebuilding the vertical structures of industry lead to a boom in traditional exporting product lines in Bulgaria, Hungary, Poland and Romania during early transition.
first. Then, once the benefits from these reforms have taken hold in the economy, the more painful reforms of tariff reductions should be implemented, but in a phased way.

We then considered the pursuit of enhanced capabilities to support exporting companies during trade liberalisation as the cornerstone of Whitaker’s industrial policy. We showed how the drive for supports for exporting in industrial policy had a strong economic framework. Whitaker shaped policy on the advice of an economist Ryan, who in turn based his concept of the importance of industry linkages in Ireland’s development on the theoretical framework put forth by the influential Hirschman (1958). Industry linkages have been shown by Li, Walsh and Whelan (2009) to be a key contributor to the success of Irish exporting.

Over time there has been a lot of institutional and organisational change in the operation of Ireland’s industrial policy. Hardiman and MacCarthaigh (2010) outline how the government agencies involved in industrial policy have changed over-time. The IDA founded in 1949 starting with a small staff of 11. Today industrial policy is overlooked by three organisations IDA Ireland, Forfas and Enterprise Ireland employing more than 1,200 that still involve academics across various committees. This would be considered a flagship of Irish Public Policy, and has had great success in implementing the vision of those in the 1950s.

As illustrated by Sweeney (1992) the fundamentals of our industrial policy have not changed since Whitaker: exporting and supporting exporting through enhanced capabilities. These fundamentals, based on sound economic frameworks, have lead to great success in the Irish economy in the past. Do we need new industrial policy for the 21st century? Can the current agency structure deliver change if needed? The Capital Investment Advisory Committee set-up in 1956 was never closed. Perhaps it is time to call it back into session.

### REFERENCES

Garvin, T (2004) *Preventing the Future: Why was Ireland so poor for so long?* Gill & Macmillan

McAleese, D (1971) “Effective Tariffs and the Structure of Industrial Protection in Ireland” The Economic and Social Research Institute, Dublin, Paper No.62, June

The Institute for British-Irish Studies was established in 1999 as an interdisciplinary resource. Its aims are:

- to promote and conduct academic research in the area of relations between the two major traditions on the island or Ireland, and between Ireland and Great Britain, from an inter-disciplinary social science perspective.

- to promote and encourage collaboration with academic bodies and with individual researchers elsewhere who share an interest in the exploration of relations between different national, ethnic or racial groups.

- to promote contact with policy makers and opinion formers outside the university sector, and to ensure a free flow of ideas between the academic and the non-academic worlds.

The Institute’s working paper series is based on work in progress. The Institute accepts no responsibility for views offered. When later versions of papers are scheduled for publication elsewhere, this is indicated on the back of the title page.
