

## **Using Learning Analytics to Aid Student Success**

**Supervisor: Dr. Anthony Cronin**

Students can often enter university underprepared and with unrealistic expectations. Technology-enhanced learning and the field of learning analytics are advancing ways in which at risk and under-represented student groups can be identified and supported to succeed in their degree. Vast amounts of educational data such as trace data from Learning management systems such as Brightspace, Blackboard or Moodle can offer insights into how students interact with such resources as well as provide understanding of students' learning behaviours. The interested candidate should be willing to learn data analytics techniques.
