Genetic Variation in Chemosensory Receptors: Linking Genetics and Food Choice

Dr. Emma Feeney

Research Program Manager, Food for Health Ireland

UCD Institute for Food and Health

17th May 2017

emma.feeney@ucd.ie

Overview

- Taste as a driver of food choice
- Taste & flavour
- Genetic differences in taste and smell
- Variations linked to food preferences
- Considerations for the consumer

TASTE : Can influence our food choice

- Personal food values
- Used to make choices
- Influenced over life course
- Can vary from person to person and within eating situation
- Taste : important food-related value

Taste – consistently no.1 factor in purchasing for last decade

What is taste?

- What we perceive in absence of smell

Also chemosensations:

- - Burning (TRPV1)
- - Cooling (TRPM8)

Figure 3. Taste transduction in (A) bitter, sweet and umami (B) Sour and (c) Salty taste

Figure 4. Taste receptors for prototypical tastes

Flavour: A multisensory perception

- taste
- smell
- trigeminal sensation

Flavour – a multisensory perception

- Taste
- Smell
- Trigeminal sensation
- Vision, sound

Figure 5. Impact of colour on taste intensity

Individual Differences in Perception

- Classic example: Bi-modal distribution of PROP / PTC intensity

Irish children: Supertasters ½ as likely to have tried green veg

Fig. 6. Data from Feeney et al, (2014) Genetic and environmental influences on liking and reported intakes of vegetables in Irish Children- Food quality and Preference

Supertaster tongue? Probably not....

Supertaster tongue doesn't seem to exist...

(Feeney & Hayes, *Chemical Senses*, 2014;
Feeney & Hayes, *Chemosensory. Percept*, 2014)

Females have a greater density
of FP than males

Fig. 7. Feeney and Hayes, 2014, *Chemosensory Perception*.

Genetic variation in bitter taste...

- Now known – 25-30 bitter taste genes
- TAS2R38 discovered in 2003
- Encodes PTC receptor
- Also binds other N-C=S compounds
- Each codes for a receptor
- Receptors may bind multiple compounds

Figure 8. Phylogenetic tree of TAS2R gene family

(Adapted from Behrens & Meyerhof, 2006)

Bitter taste receptors - GCPRs

Figure 9. Typical structure of GCPRs

Mammalian taste receptors and cells				
Umami	Sweet	Bitter	Sodium	Sour and carbonation cells
				
T1R1+T1R3 L-glutamate L-amino acids glycine L-AP4 Nucleotide enhancers IMP, GMP, AMP	T1R2+T1R3 Sugars Sucrose, fructose, glucose Artificial sweeteners saccharin, acesulfame K aspartame, cyclamate D-amino acids D-alanine, D-serine, D-phenylalanine Glycine Sweet proteins Monellin, thaumatin	~30 T2Rs Cycloheximide (mT2R5) Denatonium (mT2R8, hT2R4) Salicin (hT2R16) PTC (hT2R38) Saccharin (hT2R43, hT2R44) Quinine strychnine atropine	ENaC Low NaCl Sodium salts	PKD2L1 Acids Citric acid Tartaric acid HCl CA IV Carbonated drinks

Figure 10. TRC in mammals and their ligands, adapted from Yarmonlinsky et al, (2009) Cell

Genetic variation in umami and sweet receptor genes

Gene	SNP	Association and possible mechanism, if known	Taste quality affected
<i>TAS1R1</i>	A372T ⁽³⁰⁾	T associated with high sensitivity. Mechanism unknown	Umami
	G1114A ⁽⁹⁵⁾	A associated with high sensitivity. Mechanism unknown	Umami
	C329T ⁽⁹⁵⁾	T associated with low sensitivity. Mechanism unknown	Umami
<i>TAS1R3</i>	R757C ⁽³⁰⁾	C associated with lower sensitivity. Mechanism unknown	Umami
	R247H ⁽³⁰⁾	H associated with increased sensitivity. Possibly influences binding with L-glutamate resulting in stronger activation of taste system.	Umami
	A5T ⁽⁴³⁾	A associated with heightened perception.	Umami
	C2269T ⁽⁹⁰⁾	T more frequent in nontasters. Mechanism unknown	Umami
	C1266T ⁽⁴¹⁾	T alleles result in reduced promoter activity	Sweet
	C1572T ⁽⁴¹⁾	T alleles also result in reduced promoter activity in this mutation	Sweet

Table 1. Known SNP associations with umami and sweet perception in the TAS1R gene family, adapted from Feeney *et al.*, (2010)

Taste genetics – may affect coffee intake

Fig. 11. Mean daily coffee intake (ml/day) across variations of TAS2R43, which responds to caffeine (left) and TAS2R38, which responds to PTC (right). **Davis and Feeney (2015), presented at Pangborn, Sweden**

Taste genetics: Can affect sweetener preference

Chem. Senses 38: 379–389, 2013

Odor receptors are also implicated in food preferences..

Table 2. Functional SNPs in chemosensory genes

SNP ID/ Position	Gene	Region	Chemosensation	Reference	Liking/Intake
R88W, T133M	OR7D4		Androstenone odor, androstadienone odor	Keller (2007); Knaapilla	May affect acceptance of boar tainted pork
Not actually the SNP - the non-functional allele is a pseudogene	OR11H7P	Coding region	Isovaleric acid	Menashe, (2007)	
rs27277172	OR4N5				Cilantro preference
rs427871	TAS2R1		Bitter receptor		Cilantro preference

Adapted from Hayes, Feeney and Allen (2013) Food Quality and Preference 30; 202–216

Odor receptors....

Odorant receptors															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	Description
A 															rancid, sour, goat-like
B 															sweet, herbal, woody
C 															rancid, sour, sweaty
D 															violet, sweet, woody
E 															rancid, sour, repulsive
F 															sweet, orange, rose
G 															waxy, cheese, nut-like
H 															fresh, rose, oily floral

MODIFIED AFTER LINDA BUCK AND COLLEAGUES IN CELL VOL 96, MARCH 5, 1999

Taste receptors also found in the gut

- TAS2R38 - association with glucose homeostasis
- Gnat3 is involved in sweet taste variations - sweet perception
- Implicated in GWAS study of metabolic syndrome
- How? Interaction / signalling in gut?

(Fushan et al, Chem senses, 2010; Feeney *et al* 2013, Nutrient Sensing in the Gut, Hamburg)

Challenges: Complexity of human perception

Separating genetic variation from other taste intensity influences?

Modeling the interaction of receptors with real foods?

Modeling all known genetic variations in chemoreceptors together to predict taste perception?

Relating this to food liking?

Modeling signaling in gut?

These are just taste -Odor receptors (flavour)– over 400 known – predicting interaction??- Machine learning ?

Summary – taste is important!

- Taste is a key driver of food choices
- Taste & odour perception can vary considerably
- **Individual differences in perception – a key consideration**
 - Affects food choice, liking, drives market segmentation
 - Important to know your data, and your target group
 - Sometimes choices may be necessary
